

INTRODUCTION

India is an agricultural country. Sixty-percent populations are depended on agriculture. Agriculture is the lifeline of Ratlam district, contributing towards livelihoods for over 70% of the population. Seed is important part in agriculture life. If we define seed the living organ of the crop in rudimentary form that is used for propagation. The production capacity of crop depends upon the seed germination capacity. If the seed quality is low the production is low. Seed is so important factors that if farmer sows improve seed, the production capacity will increase 25 to 30 percent, but is bad luck that in India only 08 to 10 percent farmers change their seed and in M.P. seed replacement ratio is 03 to 05 percent. Seed supply system is other important factor, that decide the production capacity of the crop. It is essential for seed security. Seed supply system are varied reflecting that diversity of climate crop type, farming system, culture and economic. There are two important components of seed supply system – formal and informal.

FORMAL COMPONENT

It includes all government and non-government agencies like cooperative societies, Seed Corporation, registered of shops etc.

It tends to focus on larger farming operations and tend to concentrate on seed of hybrid low planting density crops.

INFORMAL COMPONENT

It includes wholesalers, retailers, local person. It provides 85 percent more of planting seeds. It is traditional roots. It refers to the collective efforts of farmers and their local communities who save and store part of their harvest for future planting, exchange seeds with relatives and other farmers or trade seed in the local market place. An informal sector largely depends on local resources and inputs. (Source: Developing a strategy for sustainable seed supply system in sub-Saharan, Africa Policies stakeholders, and coordinators)

OBJECTIVE

The present studies have been taken up with the following objectives-

- To identify different types of seeds supply chain.
- To find which type of seed supply chain are mostly used by farmers and why?
- To know the reason of the failure of the other seeds supply chain.

HYPOTHESIS

- In this research fulfill the requirements of our topic, our rational is how many type of seed supply chain in tribal area of Ratlam and will research negative and positive point of each and every seed supply chain so that government and seed agencies can help to improve the conditions.
- Which type of seed supply chain is mostly used by the farmers and reason for their using and their profit and losses?
- Which chain is more profitable or not
- The Seed Replacement Ratio (SRR) in the research are reflect negative relationship with supply chain. The proposed research and the finding there on will establish the fact the SRR is the direct function of type, quality and efficiency of supply chain.

RESEARCH AREA

The research area of seed supply chain is the tribal area of Ratlam district. It is situated in north-west region of M.P. It is bounded Mandsaur district in North, Jhabua and Dahr on the south,

Ujjain on the east, Chhitorgarh and Banswara district of Rajasthan on the west.

The study area of this research is Ajabghar, Dethla, Titri, Devpada.,Daulatpura,

IDENTIFICATION OF THE PROBLEM

Project Work at N.L.R.I., have to work on seed supply chain. I have to survey in study area about seed supply chain. There researcher face problem with interaction to Farmers, because there are some language problem. The method of supply of seeds among dealers and consumers was direct, i.e. moneylender to farmers; market retailers to farmers; cooperative societies to farmers etc.

LIMITATION OF THE STUDY

The study is based on the data provided by the N.L.R.I. and farmers of study area. The validity and reliability depends on how honestly they provided the information. The study was limited to Daulatpura, Ajabgarh, Dethla, Titri and Devpada only. The farmers do not provide appropriate answer to some questions. Like this type of study there should be a lot of time, but researcher has limited time for given task. Yet researcher has completed her study in given time perfectly. Researcher has the limitation to carry out her study. Researcher has lack of time, lack of money, lack of freedom in decision making etc.

WORK PLAN

Research wants some data like-

- (i) Primary data and
- (ii) Secondary data.

Researcher has to collect primary data by fieldwork and secondary data from literature of company, books and web sites etc. For study researcher planned to go Daulatpura, Ajabgarh, Dethla, Titri and Devpada for collecting primary data.

ORGANIZATIONAL PROFILE

Livelihoods consist of the capabilities, assets - both material and social resources - and activities required for a means of living. A livelihood is sustainable when it can cope with and recover from stresses and shocks, maintain or enhance its capabilities and assets, and provide net benefits to other livelihoods locally and more widely, both now and in the future, while not undermining the natural resource base. Gramin Vikas Trust (GVT) is very clear in its perspective of socio-economic development with a professional and positive outlook.

Gramin Vikas Trust (GVT), committed for development of the rural livelihoods was established by Krishak Bharti Co-operative Limited with the support from Govt. of India and Department for International Development (DFID), U.K. The mission of the GVT is to act as a catalyst to enable the rural communities to improve their livelihoods in the resource poor areas.

While working with over a million people during the past one and half decades, GVT has had a diverse portfolio of activities aimed at providing and enhancing the livelihood of communities in over 150 villages across eight states. GVT specializes in fields like natural resource management, watershed development, agriculture, livelihood improvement, institutional development, women empowerment, labour supports and micro enterprise development. After gaining years of experience working on the development of rural economies, GVT has established National Livelihoods Resource Institute in Ratlam, M.P. to share its experiences with a wider audience through an annual calendar of client-responsive activities like interactive training, participatory research etc.

Gramin Vikas Trust has been registered, under Indian Trust Act 1882, at New Delhi, vide Registration No. 1501/4 dated 4th May 1999 (Book No. IV, page no. 145-163). Its Registered Office is: 49-50 Red Rose House, Nehru Place, New Delhi 110 019 and its corporate office is in Noida, U.P. GVT is exempted against Income Tax under section 35 AC of Income Tax Act.1961. It is registered under Foreign Contribution (Regulation) Act, 1976 besides it also has exemption under section197 (1) of the Income Tax Act 1961. GVT is registered under Foreign Contribution (Regulation) Act, 1976, with registration no. 231660318.

Gramin Vikas Trust (GVT) founded by one of the country's largest fertilizer cooperatives (KRIBHCO), Gramin Vikas Trust (GVT) has been developing innovative solutions for the livelihoods security of poor and marginalised people since the early 1990's.

Western India Rainfed Farming Project and the counterpart Eastern India Rainfed Farming Project have been two of its leading flagship interventions. They helped GVT stretch its reach into Rajasthan, Gujarat, Madhya Pradesh and Chhattisgarh in the west and Orissa, Jharkhand and West Bengal in the east.

GVT has implemented its projects in some of the most telling conditions on the country's landscape, where poverty has been at its worst and ecological conditions most hostile. Yet, these have proved a boon to GVT, which, through sheer perseverance and sustained innovation, has developed benchmarks in rural development. In its pursuit for excellence, GVT has partnered with hosts of agencies including DFID, UNDP, Rockefeller Foundation, European Union, government departments, research institutions, non governmental organizations and village communities.

Gramin Vikas Trust (GVT) was established as an independent legal entity by KRIBHCO, a premier fertilizer company of India, in the cooperative sector under the Government of India. For the past one and a half decades, it has managed and implemented

programmes for enhancing Sustainable Livelihood development and poverty reduction and empowering communities to manage resources in rural and tribal areas, initially under direct control of KRIBHCO, and since 2000, independently. Initial funding was made available by DFID-UK.

Vision - 2010

To Become a Vital Player Reducing Rural Poverty in India Through Sustainable Livelihoods.

Mission

Center for Excellence Empowering Rural Poor to Improve Livelihood Sustainability.

Goal

To develop, implement, disseminate, effective and equitable and sustainable participatory policies and programmes for reducing rural poverty in the rainfed areas of India.

Objectives

GVT believes that community participation in development programmes is crucial towards ensuring peoples' contributions, financial as also their physical energies and innovative insights. This belief underlies GVT's objectives:

- To improve socio economic conditions of the poor and the marginalized
- To develop gender responsive participatory approaches
- To establish village based institutions for sustaining change
- To maintain partnerships with diverse stakeholders
- To promote, coordinate and conduct applied research
- To create a center for knowledge assimilation and sharing

Strength of GVT

- Long experience in sustainable livelihood support in the Rainfed and resource poor tribal areas.
- Successful participatory models in farming system development.
- Experience of on & off-farm income generating activities (IGA).
- Experienced and qualified Field Expertise in Watershed Management, Agriculture, Livestock, SWC & WRD, Social Development and Aquaculture etc.

- Programmes being implemented and disseminated through a cadre of more than 6000 Jankars (trained para-professionals).
- Tested cost-effective Prasar (Dissemination) Strategies.

GVT works with the poorest and most marginalized people of the country in eastern and western India. We work in:

- Remote and unreachable villages where the rays of development have not reached.
- Areas where the SC/ST population is more than 75%.
- Ecologically poor rainfed areas of western and eastern India Areas that receive rainfall very erratically.
- Areas where the topography is hilly and undulating.
- Degraded forest areas.
- Land ranging from low-land valley bottoms to sloping uplands.

COMMUNITY LEADERSHIP THE JANKAR SYSTEM

GVT has successfully developed the Jankar system for empowering the community, skill and capacity building for adoption of suitable technology with their active participation, and sustainable improvement in their livelihood. The Jankar is the interface between the community and the project and facilitates the development of the community.

NATIONAL LIVELIHOODS RESOURCE INSTITUTE (NLRI)

GVT has established a state-of-the-art National Livelihoods Resource Institute (NLRI) on the picturesque locale outside the city of Ratlam in Bhadwasa Village in Jaora block of Madhya Pradesh.

This flagship initiative of GVT will become a repository of GVT's experiences of the past two decades that it intends to share

with a wider audience through an annual calendar of client responsive activities like interactive training, participatory research and appreciative inquiry into the intricate inter-linked world of rural livelihoods.

NLRI is in the process of evolution and seeks partnerships at various levels, to refine and further its objectives. The ultimate goal is to develop this national center into a one-stop shop for understanding livelihoods, for diagnosing ground situations and to develop prescriptions for interventions.

The services on offer will be tailor made to suit the emerging needs of the donor projects, public private partnerships, and government programs and last but not the least, local communities and their leadership. NLRI has established its own nursery to meet the requirement of the plants for the institute and the farmers also.

ORGANIZATIONAL STRUCTURE

Structure of N.L.R.I.

PROFILE OF THE STUDY AREA

This chapter deals with the information of study area, which covers the total geographical area, land use pattern, cropping pattern, net sown area and total area under different crops of the Ratlam district.

Ratlam is one of the important Districts of Madhya Pradesh Which is situated in the North West part of the State "The MALWA" Region. The New Town of Ratlam was founded by Captain Borthwick in 1829 with regular and broadened streets and well built houses. Ratlam was once one of the first Commercial Towns in Central India being the centre of an extensive trade in opium, tobacco and salt. It was also famous in Malwa for its bargains called States. Before the opening of the Railway Line to Kahndwa in 1872, there was no better mart than Ratlam.

The District of Ratlam was created in June 1948 and was reorganized in January 1949. It covers the area of the former princely State of Ratlam, Jaora, Sailana, Piploda. Ringnod Tehsil of Dewas Senior, Alot Tehsil of Dewas Junior and parts of Mandsaur Tehsil of Gwalior State, a few villages of Dhar State and Chief Commissioners provinces of Pant Piploda. The District is known after the Headquarters town, Ratlam which was also the headquarter of Princely State of Ratlam.

GEOGRAPHICAL LOCATION

Ratlam is situated in North-West region of Madhya Pradesh from 23 05' North to 23 52' North Longitude and 74 31' East to 75 41' East Latitude. It is bounded by Mandsaur District in North, Jhabua and Dhar on the South, Ujjain on the East, Chhitorgarh and Banswara District of Rajasthan on the West, Shajapur District of Madhya Pradesh and Jhalawar District of Rajasthan on the North.

AREA AND ADMINISTRATIVE UNITS

Total Area of Ratlam District is 4861 Sq.km. which is 1.11% of Total Area of Madhya Pradesh. For the Administrative convenience, Ratlam is divided in Six Tehsils and 6 Blocks

Town Population : 27,970

Rural Population : 1,23,648

Total Population : 1,51,618

Total District Area : 4861 Sq.Km. Population as per 1991 census 9,71,888

Above graph shows that the town population is 18 percent while rural population is 82%. The maximum population of study area is rural.

CLIMATE

The Average temperature of Ratlam is 55 F. The average rainfall of the District is 90 cm. Most of the rains occur in the month of July and August.

MODE OF TRANSPORT

Ratlam is well connected both by Rails and Roads. Ratlam junction is Divisional head quarters of Western Railways. It has both Broad Gauge and Meter Gauge Railway Lines. Ratlam is

situated on State Highway number 31 and 22. Ratlam is well connected by road to Madhya Pradesh and other states namely Gujarat and Rajasthan.

BUSINESS

Ratlam has several chemical factories namely JVL, Hightech, IPCA, Shaba Chemicals, Bordiya Chemicals, Sujjan Chemicals etc. There are a number of manufacturing units of Copper wires and plastic rope etc. Ratlam is also famous for its gold and ornaments for its purity and designs. Ratlami Namkin (sev) is famous through out the country.

Madhya Pradesh lies in the middle of the India, sharing its border with six neighbouring states. The northern borders of the state has two neighbour states namely the state of Rajasthan and Uttar Pradesh. The western border of the state is shared by a part of Rajasthan and a part of Maharashtra with Gujarat in between. On the southern part of the state of Madhya Pradesh lie the states Maharashtra and Adnhra Pradesh. The entire eastern border of eth state is bounded by the states of Chhatisgarh and Jharkhand. A number of significant rivers flow through this land. Thus, with the mountain ranges, rivers along with the plains, Madhya Pradesh has a varied physical feature.

The total geographical area the state of Madhya Pradesh covers is approximately 308000 sq.km divided among the 45 districts of the state. Forest cover a major part of the state and the cultivated area accounts t almost half of the total landmass of the state. The state covers a wide area of the Inidan Plateau region.

LAND USE PATTERN:

Table-3.1: Land use pattern of Ratlam

Particulars	Area (in thousand hectare)
Geographical Area	486.10
Cultivable land	325.0
Cultivable waste land	2.43
Un-cultivable land	68.0
Forest land	49.0
Fallow land	4.86
Other uncultivable land excluding fallow land	29.10
Total irrigated land	30.34

Source: District Agricultural Department, Ratlam

Ratlam covers 486.10 thousand hectares geographical area, 325.0 cultivable land, 2.43 cultivable waste land, 68.0 uncultivable land, 49.0 forest land, 4.86 fallow land, 29.10 other uncultivable land excluding fallow land, 30.34 thousand hectares total irrigated land.

The total irrigated land is 30335 hectares, which has been irrigated through following means. Electric distribution system in Ratlam is in control with M.P. West Electric Distribution Company Limited. They have covered the 1051 villages of Ratlam district. But it is not properly distributed in few tribal villages of tribal block

Sailana and Bajna. The total area of Ratlam district is 4861 sq.km.

The Ratlam district having six tehsil and six blocks.

Table 3.2: AREA UNDER PRINCIPLE CROPS CULTIVATION

S.No.	Crop	Area under cultivation (in ha)
1.	Wheat	99180
2.	Channa	68690
3.	Juwar	4910
4.	Maize	63040
5.	Urd	10530
6.	Soyabean	181610
7.	Groundnut	370
8.	Kapas	24165
9.	Rice	520
10.	Moong	850
11.	Pea	1100
12	Arhar	1220

Table and graph shows that the cultivation of wheat, chana, juwar, maize, udad, soyabean, groundnut, kapas, rice, moong pea and arhar is 99180, 68690, 4910, 63040, 10530, 181610, 370, 24165, 520, 850, 1100 and 1220 ha. It shows that the maximum production of soyabean (in 181610 ha), Kapas has second place with in 24165 ha area.

Table 3.3: Electricity distribution

Sr.No.	Detail	Numbers
1.	Electrified villages	1051
2.	Electric connection	200616
3.	Urban	117399
4.	Rural	85217

Source: District Agricultural Department, Ratlam

Table and graph 3.3 shows that 1051 villages are electrified in which 200616 villages have electric connection. urban area has 117399 while rural area have 85217 number.

IRRIGATION:

Table 3.4: Irrigation

S.No.	Name of structure	Numbers	Constructed by / own by
1.	Talab	152	Community
2.	Talab	16	Private
3.	Small Percolation taken / stop dam	110	Watershed committee

4.	Medium Tank	1	Irrigation Deptt.
5.	Pick up weir	1	Irrigation Deptt.
6.	Stop dam	1	Irrigation
7.	Lift irrigation	8	Irrigation Deptt.
8.	Small tank	56	Irrigation Deptt.
9.	Stop Dam	557	Panchayat
10.	Percolation tank	698	Panchayat
11.	Farm pond	3571	Panchayat / Private
12.	Well	5990	Private

Source: District Agricultural Department, Ratlam .

Table 3.4 shows that irrigation in most of the area is doing by the tube well drilled personally by the farmers.

RESEARCH METHODOLOGY

The Project Report entitled "COMPARATIVE STUDY OF THE SEED SUPPLY CHAIN IN TRIBAL AREA OF RATLAM DISTRICT IN MADHYA PRADESH" was assigned by N.L.R.I.

As per the objectives of the Project Report, the research methodology was developed under the following heads-

SELECTION OF STUDY AREA

The study confined to Ratlam district. The selected area for field survey are as follows- Ajabghar, Daulatpura ,Dephla, Titri, Devpada.

Table - 4.1: SELECTION OF VILLAGES

Name of Village	Area of Village	Household	Total Population	Land Holding	
				Less than 1 ha	Less than 1-2 ha
Daulatpura	144	62	382	15	47
Ajabghar	172	46	329	12	34
Dethla	329	70	487	16	54
Devpada	316	115	647	22	93
Titry	-	-	-	-	-

Table 4.1 shows about study area i.e. area of village, total household, total population and land holding.

SAMPLING DESIGN

There are 10 villages selected for field surveys in each village 05 farmers were selected for collecting data. Among them we were take a personal contract and try to know their seed purchasing methods of different crops. And other ten farmers were divided into two groups in which five farmers of each group have taken to participate in FGD. The study confined to Ratlam district. The selected area for field survey is as follows- Daulatpur, Ajabghar, Dethla, Titri and Devpada.

Table - 4.2: SELECTION OF FARMERS

Sr. No.	Name of Village	Name of Farmers
1.	DAULATPURA	1. KANTIBAI PARKI 2. BADDO KANKUBAI 3. GALYA 4. KAMJI 5. MOHAN 6. BABU 7. DULSI 8. NAGDU 9. NATTHU 10. LALU CHAND

2.	AJABGHAR	1. NANURAM 2. LALCHAND 3. BADRILAL 4. PHOOLJI 5. DASHRATH 6. THABARJI 7. HINDUJA 8. PRAKASH 9. RAJU 10. DUKL SINGH
3.	DETHLA	1. BABULAL 2. RANGANATHU 3. RAMESH 4. LILA 5. MANGLI DOBALIYA 6. DALLU 7. BHANGU 8. SAGAR 9. DEVILAL 10. SAMHU

4.	DEVPADA	1. LAXIMAN 2. MUNNA 3. SANGEETA 4. DADU 5. PRAKASH 6. NARAYAN 7. SUGNA 8. MOHANDHARM 9. NARAYAN AMRA 10. ROSHAN
5.	TITRI	1. JALAM 2. RAMCHANDRAJI PATIDAR 3. JITENDRA PATIDAR 4. RAMNARAYAN PATIDAR 5. OMPRAKASHJI VISHNUJI PATIDAR 6. ANIL BADRI LAL PATIDAR 7. SAMARATH JHAMAKLAL PATIDAR 8. SURESH RUNCHURJI PATIDAR 9. JAMUNARAMRATAN PATIDAR 10. NITIN MOHAN PATIDAR

Table 4.2 shows the selection of farmers. Five farmers have been selected from each village.

DATA COLLECTION METHOD AND SOURCES

Data was collected through sample survey method with the help of questionnaire to interview the farmers. We met the farmers and members individually and ask different types of the questions related supply purchasing method. As per the objective of study, primary and secondary data have been. Primary data were collected from the farmers through personal interview and group discussion. That is name of the farmers, total cultivated land, total irrigated/un-irrigated land, source of irrigation, which types of seed, profitability, seed purchasing method etc. In personal contract researcher visited to various places and discussed with farmers, retailers and wholesalers.

Group discussion means to collect the more information with large number of farmers in the minimum time in one place. I met to 10 farmers in the and asked questions in the group and I collected information and data for many people at one place.

Secondary data were collected from the office of the Agricultural Department, officials of N.L.R.I., GVT and Internet. The secondary data have been pertaining status of the total cultivation area in study villages. Researcher consulted libraries, reports, booklets etc.

PERIOD OF ANALYSIS

The primary and secondary data pertain to the period of 45 days. Period of training was 15th May to 30th June, 2009.

METHOD OF ANALYSIS

The collected information and data from the various sources were systematically tabulated and analyzed by using the simple percentage method.

RESULT AND DISCUSSION

In tune with the objectives and methodology the results of the project entitled "COMPARATIVE STUDY OF THE SEED SUPPLY CHAIN IN TRIBAL AREA OF RATLAM DISTRICT OF MADHYA PRADESH" discussed in this chapter which deals with the systematic presentation of status of the seed supply among farmers.

Researchers have selected for survey i.e. Farmers and Retailers with personal contact. Group discussions were made among farmers. Researcher visited various places for survey. There are five main villages for field survey. The villages name is as follows-

1. Daulatpura
2. Devpada
3. Ajabghar
4. Dethla
5. Titri

Table-1: PURCHASE PREFERENCE OF SEEDS AMONG FARMERS

Sr. No.	Particular	No. of Respondents	Percentage of Respondents
1.	Moneylender	27	54
2.	Market	12	24
3.	Societies	9	18
4.	Relatives	2	4
Total		50	100

Above table and graph shows that maximum number of farmers purchased seeds from moneylender while minimum percentage of farmers purchased seeds from their relatives.

Table-2: USE OF SEEDS VARITY

Sr. No.	Particular	VARITIES	No. of Respondents	Percentage of Respondents
1.	Maize	Desi	24	48
		Sathi	12	24
		White Maize	8	16
		Sariram	6	12
TOTAL		-	50	100
2.	Soyabean	JS0335	31	62
		JS9305	6	12
		JS-7322	7	14
		JS-7105	6	12
TOTAL		-	50	100
3.	Cotton –	BT Cotton	20	40
		Varalakxmi	18	36
		Pramukh	12	24
TOTAL		-	50	100

The above table and graph shows that the farmers of study area use the different types of seeds of maize, soyabean and cotton.

Table-3: PURCHASING OF SEEDS FROM GOVERNMENT SOCIETIES

Sr. No.	Particular	No. of Respondents	Percentage of Respondents
1.	YES	19	38
2.	NO	31	62
Total		50	100

Above table and graph shows that a maximum number of farmers are not interested to purchase seeds from government organization. Their percentage is 62, while 38 percent wants to purchase from government organizations. The cusses may be that government system is complex in comparison of private sectors.

Table-4: UN-WILLINGNESS TO PURCHASE SEEDS FROM GOVERNMENT

Sr. No.	Particular	No. of Respondents	Percentage of Respondents
1.	Black Marketing	12	24
2.	Un-availability in time	21	42
3.	Critical Official Work	10	20
4.	Employees rude behaviour	7	14
Total		50	100

The above table and graph shows that farmers are not interested to purchase seeds from government organization because of Black Marketing, Un-availability in time, Critical Official Work and Employees rude behaviour, 24%, 42%, 20% and 14 respectively.

Table-5: PREFERENCE OF PURCHASE SEEDS FROM SAHUKARS

Sr. No.	Particular	No. of Respondents	Percentage of Respondents
1.	Easily Availability	13	26
2.	Credit availability	12	24
3.	Less official work	8	16
4.	Good behaviour	2	4
5.	All above	15	30
Total		50	100

The above table and graph shows that the percentage of preference to purchase seeds from Sahukars are - Easily Availability (26%), Credit availability (24%), Less official work (16%), Good behaviour(4%) and All above (30%).

Table-6: PURCHASE PREFERENCE OF SEEDS (CREDIT/CASH)

Sr. No.	Particular	No. of Respondents	Percentage of Respondents
1.	Credit	41	82
2.	Cash	9	18
Total		50	100

The above table and graph shows that maximum percentage of farmers wants to purchase on credit which percentage is 82, while minimum percentage of respondents wants to purchase seeds in cash.

**Table-8: FARMERS PREFERENCE OF PURCHASING SEEDS
FROM SAHUKARS SHOP**

Sr. No.	Particular	No. of Respondents	Percentage of Respondents
1.	YES	46	92
2.	NO	9	18
Total		50	100

When researcher tries to know that purchasing preference the answer was found that 46 percent respondents prefer to purchase seeds form retailers shop while 09 percent respondents wants to purchase seeds from governmental societies.

SWOT ANALYSIS OF NLRI

STRENGTH

1. National Livelihood Resource Institute (N.L.R.I.) is working toward upliftment of rural areas.
2. NLRI have a good supply chain.
3. It have well network for seed supply chain.
4. NLRI have sufficient technical staff.
5. Farmers, retailers, distributors groups are satisfied with NLRI.
6. Timely and proper supply chain of the product.
7. Good incentives for dealers, retailers, and distributors.
8. NLRI facilitating and supporting season migrant labors from semi-arid regions to both better off areas and urban areas.
9. NLRI have initiatives considered as best practices by both government and non-government organizations and emulated on wider scale in various parts of the country.

WEAKNESS

1. Publicity of new varieties, which is profitable for farmers, requires more and more advertisement. So that all farmers have to be able to know the merits of supplied seed by NLRI.
2. Technical field staff should be increased. The field staff should be more trained in agricultural farming.

OPPORTUNITY

1. The opportunity of seed is increasing day by day. Farmers are aware for new seeds for increasing their productivity. High market potential, enough scope for expansion for seed is available in study area.
2. As the agricultural technology advances, there will be need for new varieties of seeds.
3. A good system of seed supply can make more and more profitable.

THREATS

1. The area is tribal and development is very slow and lacks of publicity are also available. There is very little education. They believe in tradition.

2. Many times crop failure due to poor climatic conditions reflects the sale of product.
3. Large numbers of competitors and price war between them.
4. Lack of awareness for the timely and rational use of supplied seed.
5. Money lender (Sahukars) are very effective in study area, they do not like that villagers should be developed in economic condition. NLRI is trying to change mandate of that area, yet at present NLRI looks fails to grows proper economic condition for poor villagers.

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

**Titles: "COMPARATIVE STUDY OF THE SEED SUPPLY CHAIN IN
TRIBAL AREAS OF RATLAM DISTRICT OF MADHYA
PRADESH"**

Collecting data we analyzes that in all five villages in Ratlam district, there are four seed supply chain are found. These are- Moneylender to farmers, market - retailers to farmers, cooperative societies to farmers and relative to farmers. For example in Daulatpura and Devpada farmers like to purchase seed to money lenders because there are many positive aspects which force them to purchase seed to the money lenders. Firstly the distance from cooperative societies to villages is very high, they can not bear high charges of transportation. But moneylenders provide seeds in local areas so they like it. Poverty is second main reason because there economic condition is very poor and they cannot purchase seed in cash. Why no government societies provides seeds on the basis of credit. So forcedly they have to purchase seeds to the money lenders. the third and last point is that agriculture is based on season. So money lenders is best sources who provide seeds, funds to the farmers for short term in easy way and in locality. While in Ajabgarh

and Titri mostly farmers are rich and prosperous. So they do not like seed to the moneylenders but to purchase from market. Because market seed is certified. They can get it in right time with different varieties and these varieties are take less time in high yielding. But government agencies is do not providing new varieties of seed in time. The officers' charges high commission and supply the seeds in black marketing. The processing of seed purchasing is very long and complex. So farmer do not involved. But is Delthla mostly farmers' purchase seeds from the cooperative societies, Because according to them cooperative societies provides many facilities to the farmers, like provides all inputs in high technologies and also inform them how to use it. Their seeds are satisfied and free form all diseases.

Seed replacement ratio is other important ration that affects the seed supply chain of the crop. If seed supply chain is good, seed replacement will increase and production capacity will increase. Because when seed manufacturer provide high-tech foundation seeds to the farmers. They use it in easy way. But poor transportation, lack of knowledge, poverty, corruption it is not possible, that's why the result is that the production is decreasing. In Ratlam district in all five villages farmers like to use different types of varieties but lack of good seed supply chain they are unable to purchase seed of different varieties in right time.

PROFIT ANALYSIS

If we analyze four types of seed supply chain on the basis of profit we find that "Cooperative societies to farmers". Supply chain is more profitable than the other. Because inspite of all the problem cooperative societies is providing many facilities, like seed is more reliable and good quality, their germination power is guaranteed, their foundation seeds of F1 and F2 level, their physical purity is high level and provides high yielding production. Government provides subsidies and supply the seeds in right time and also provide insurance facilities and weighting facilities without any charges. But all those types of seeds, which provide by moneylenders are not profitable because they have monopoly who decides the price according himself. Their seeds are not certified and may be affected by disease. While "market to farmers" supply chain is less profitable, because retailers provide seeds including their own profit and they have no research team. In that types of seeds all tax like VAT are include. Farmers have to pay extra charges like packaging, transportation and Weighting charges.

PRICE ANALYSIS

If we analysis this topic on the basis of price we find out that "money lender to farmer" supply chain recommends high price, because monopolist of the villagers who decide the price according to

himself. The demand of product is high, the supply is less, than the price of product increase. So in that situation to fulfill the requirement of his farm forcibly farmers have to purchase seed to the moneylender with high price and high interest. Why in cooperative societies price is decided by government which is more reasonable than the market price, because select the price on the welfare of the farmers.
